While both Adobe Photoshop and iOS may offer similar features such as the Hue/Saturation button, there are some functions that Photoshop offers that iOS doesn't cover. These include the ability to crop the image by a combination of dragging the green handles and using the'straight' brush, which lets you create straight lines using any brush, and even zoom out for selective image editing. You can also use the'soft-edged' brushes to make the edges jagged. In detail, Lightroom 5 may be considered to be an update to the previous version that is based on Lightroom 3.97. The main goal of the new version seems to be to rejuvenate the program and make it more user-friendly. First, let's take a look at native RAW files in the RAW editor of Photoshop. These are the files that are named after the camera. For example, Nikon D3100 RAW files are named nikon.NEF-1.RAW, nikon.NEF-2.RAW and so on. When you open these files in Lightroom 5, you'll see the basic information about the allowed editing range, thermal noise, versions, file size, and so on. Now, let's take a look at Nikon D7000 RAW files. You can easily recognize Nikon D7000 files because of their more extensive information. For example, you can find the image size, file size, etc. There is also a preview information about the image settings, such as ISO, shutter speed, aperture, etc. If you compare a Nikon D7000 file with a Nikon D3100 file, you'll see that it is fairly larger. That is because the D7000 file is compressed, and the D3100 file isn't. You can also find a lot of metadata that is extremely different between the two files, and, more importantly, changes when the D3100 file is opened later in the Photoshop. Therefore, if you are using Lightroom 5, it is better to keep your D7000 files in a "RAW" folder.
